

# Narcotics Testing

The Narcotics Analysis Reagent Kit can identify illegal drugs in a matter of seconds. To conduct a test, simply remove the cap from the appropriate tubette and add a small quantity of the suspect substance. Recap the tubette and crush the ampoule in your hand. Shake gently and then match the reaction with the color chart that comes with the kit.

## Standard NARK® Kit

This kit contains enough reagents for 80 individual tests. Reagents are packaged in disposable tubettes that are made of paper-thin glass. This kit comes with 10 tests of the following reagents: NAR10001, NAR10002, NAR10003, NAR10004, NAR10005, NAR10006, NAR10007 and NAR10008 (see list below for more details). You'll also get one dropper bottle of acid neutralizer, poly bags for safe disposal of tested units, a carrying case and instructions.

## NARK®II Narcotics Analysis Reagent Kit

Ace's NARK®II Progressive System of Drug Identification has the capability of presumptively identifying several families of substances suspected of being abused drugs. It is designed to function as a transportable narcotics laboratory and is available for use wherever the need for its capability might arise.

Each of the tests is comprised of one or more chemical reagents. When a predictable color or series of colors occur within a specific testing sequence, a positive confirmation may be presumed. Presumptive identification is generally recognized within our legal system as a component of probable cause.

There is no drug identification system presently in use which completely eliminates the occurrence of false positives and false negatives. A forensic laboratory is required to qualitatively identify an unknown substance.

### Three Progressive Steps

**STEP 1:**  
After removing the clip, insert a small amount of suspect drug into the test pouch.

**STEP 2:**  
Break the ampoules from left to right and briefly agitate.

**STEP 3:**  
Analyze the resulting colors.
